

Our project will be a website called CUDormReviews (inspired by CUREviews) that lets users submit and view reviews for all of the different dorms of Cornell. When you enter the site, there will be a homepage with a background image, a search bar to search for the dorm you are looking for, a list of all the dorms (with clickable links for each that take you to a unique page about the dorm), and a section with filters to search by. When you search for a specific dorm or edit one of the filters, the list will change to only display dorms that match your search and filter criteria.

On the dorm-specific pages, there will be some general information including whether it has AC/elevators/a dining hall, its size, and single, double, triple, and quad availability, and also some review-based information. The review-based information displayed will be the average rating given by users for several categories, including social life, convenience, cleanliness, noise, lounges, and quality/appearance. There will also be a list of individual user reviews displayed. In addition, there will be a space to leave your own review. One possible additional feature the site might include is an option to directly compare two dorms side-by-side.

The general, non review-based information for each dorm will be entered manually inside of our program (hardcoded).

For the database, we will have different collections representing different dorms. Each document in the collection will represent a review, and each field in each document will represent the different attributes of the review (including the textual review itself).
